Park Doly

I shape the interface and build what sits beneath it.

- Fullstack development
- UI/UX design
- AI chatbots

Want the technical details? Ask for a walkthrough on GitHub.

Design and code, under one roof.

One partner from the first flow to the final deployment. Clear scope, a fixed end date, and no retainer you do not need.

Web product build

Next.js or React, design to code, performance and accessibility in the same pass.

Typical scope · 2–4 weeks

UI/UX sprint

Flows, high-fidelity screens, a working prototype, and a clean handoff.

Typical scope · 1–2 weeks

AI chatbot + training

A retrieval chatbot for your own documents, workflow automation, and a workshop for your team.

Typical scope · 1 week

One person. Every layer.

Working style

Design-minded, code-driven

I am Park Doly, a fullstack developer who cares about how a product feels as much as how it works. I work with founders and small teams to turn a rough idea into something people can use.

That means fewer handoffs and a tighter loop: understand the problem, shape the experience, build the system, and stay for the details that make it hold together.

Next.js · React · TypeScript · UI/UX · AI retrieval · Team training

Closed-source work.

Most of what I build for companies never appears on GitHub.
This is the part I can describe.

Enterprise workforce & AI copilot platform

Sep 2026 — Present

Fullstack software engineer · Retail network · 140+ locations · 2,400+ workforce profiles · closed source

- **Scalable React SPA architecture.** Engineered a high-performance SPA with React 18 and Vite for a retail network of 140+ locations managing 2,400+ active workforce profiles, reducing dashboard load times and holding sub-100 ms UI interactions through targeted state caching.
- **End-to-end optimistic concurrency.** Atomic version-checked mutations on MongoDB paired with frontend optimistic cache recovery and 409 Conflict handling, eliminating race conditions and lost updates during concurrent multi-manager shift scheduling.
- **Real-time event engine.** Bi-directional Socket.IO pipeline with REST fallback for instant shift alerts, plus client reconnection routines and idempotency dedupe keys (clientMessageId).
- **In-app AI copilot (policy RAG).** Python/FastAPI sidecar with MongoDB Atlas Vector Search (384-dimension cosine index) for internal policy Q&A, and a streaming chat UI with verifiable citation metadata (document / version / source).
- **Authentication hardening.** Refresh token family rotation backed by MongoDB TTL indexes for auto-revocation, Argon2id password hashing, and AES-256-GCM credential encryption.

React 18 · TypeScript · Vite · Node.js · Express · Python (FastAPI) · MongoDB Atlas · Atlas Vector Search · Socket.IO · Tailwind CSS

More client work sits under NDA. Ask on WhatsApp for a walkthrough.

Have a product in mind?

Let's make it useful.

Tell me what you are making, where it is stuck, and what done looks like.
